HWRF 2012 grid configuration

Initialized at 2011090300 – 12 (h) fcst valid at 2011090312
HWRF Domain Katia 12L

Atmospheric configuration

- Horizontal grid spacing: 27, 9, 3 km
- Inner nests move to follow storm
- Domain location vary from run to run depending on storm location
- 42 vertical levels
- Model top 50 hPa

Oceanic configuration

- Horizontal grid spacing: 18 km
- Size, location of grid depends of location of storm
- Pacific
 - 1-D (column) model
 - 16 vertical levels
- Atlantic
 - 3-D model
 - 23 vertical levels

DTC Goal: Tech Transfer to Hurricane NWP

Current focus in Hurricane WRF model

1. User Support

- Support the community in using an operational hurricane model

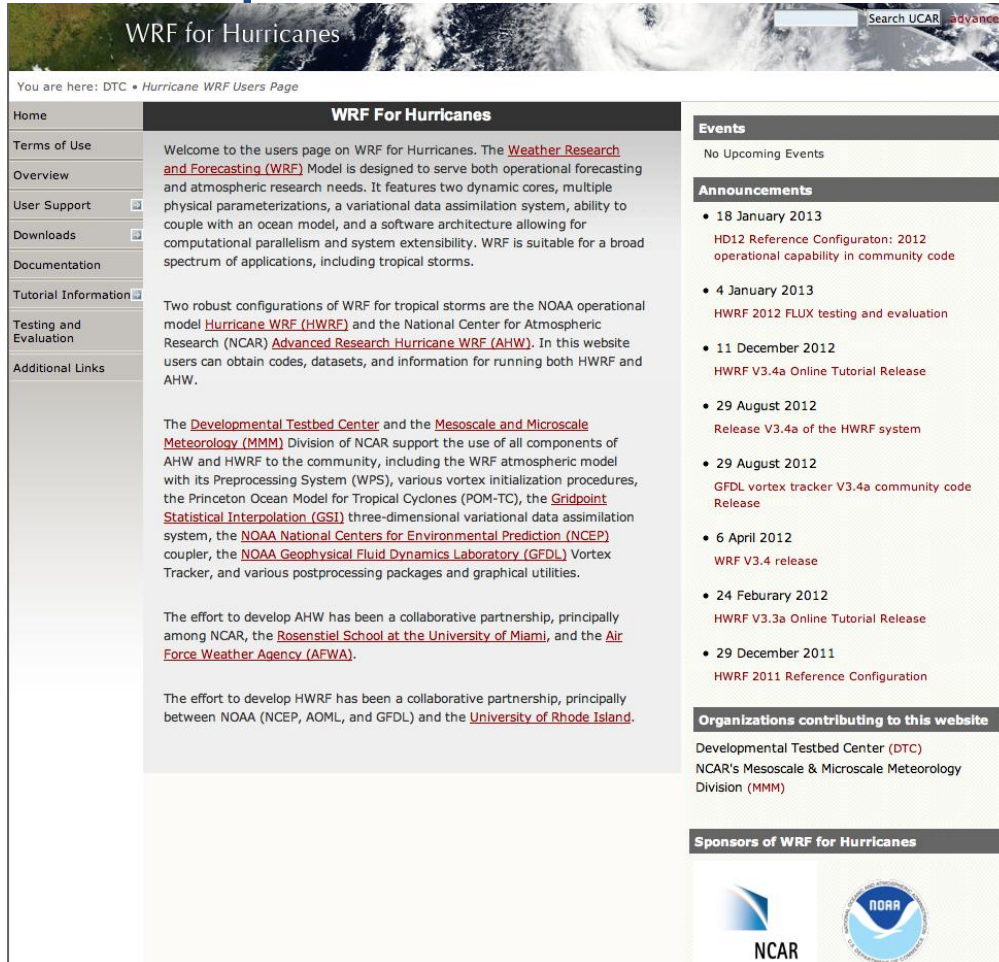

2. Code Management

- Create a framework for NCEP and the research community to collaborate; maintain the code unified

3. Testing and Evaluation

- Perform tests to assure integrity of community code and evaluate new developments for potential operational implementation

Developmental Testbed Center support

The screenshot shows the 'WRF for Hurricanes' website. At the top, there's a header with the title 'WRF for Hurricanes' and a search bar. Below the header, a breadcrumb trail reads 'You are here: DTC • Hurricane WRF Users Page'. A left sidebar contains a navigation menu with links: Home, Terms of Use, Overview, User Support, Downloads, Documentation, Tutorial Information, Testing and Evaluation, and Additional Links. The main content area is titled 'WRF For Hurricanes' and contains several sections: a welcome message, a list of two robust configurations (HWRf and AHW), a paragraph about the Developmental Testbed Center and Mesoscale and Microscale Meteorology (MMM) Division, a paragraph about the effort to develop AHW, and a paragraph about the effort to develop HWRf. On the right side, there are sections for 'Events' (No Upcoming Events), 'Announcements' (a list of recent releases and updates), 'Organizations contributing to this website' (listing DTC, NCAR, and MMM), and 'Sponsors of WRF for Hurricanes' (showing logos for NCAR and NOAA).

Benchmarks available

Current release: HWRF v3.4a (2012 operational)

Next release: HWRF v3.5a (2013 operational) – June 2013

Code Unification

Motivation: assure that the code used operationally by HWRF developers, community, and operations does not diverge

Approach: single code repo hosted at DTC links to community codes

- Complex as HWRF components are used by many other groups
- Requires a lot of checks to make sure HWRF code does not get “broken” by outside contributions
- WRF component of HWRF remained “isolated” 2007-2010, but was integrated in the general WRF repository in 2011, opening many doors for collaborations

Access to developmental codes

Motivation: developers need to collaborate in experimental code

Approach: support developers get/deliver code to centralized location

For HWRF friendly developers, DTC/EMC now provide

- Access to the unified HWRF code repository hosted by DTC
- Access to the latest experimental codes
- Ability to create your own branch, with a clear path to incorporate development in the centralized code
- Synchronization of developmental and community codes
 - Prevents HWRF developmental code from aging off
 - Provides collaboration opportunities

Currently supporting 63 friendly developers

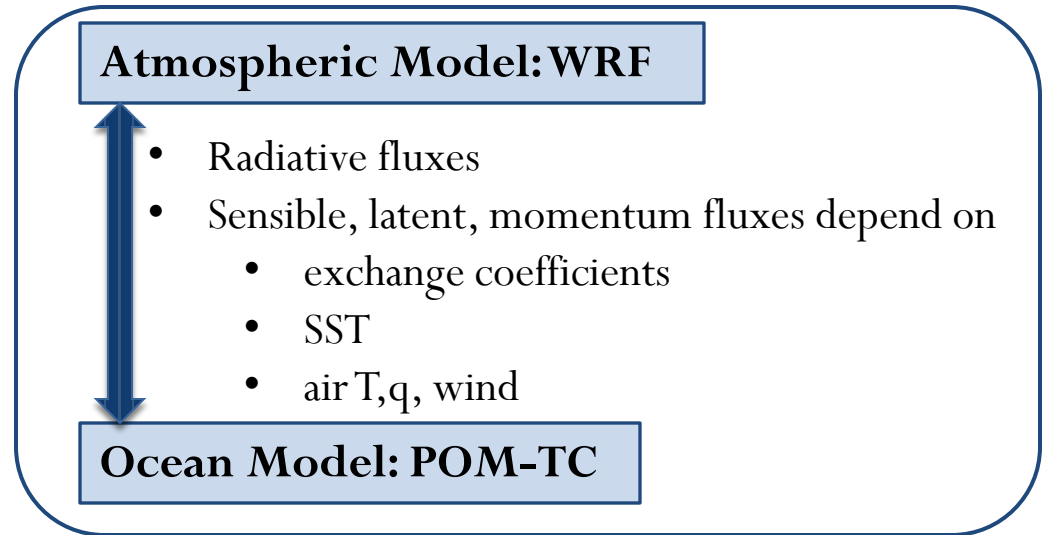

HWRF Testing in DTC (2012)

- **Case studies**
 - Alternate physics (Thompson MP & RTMMG radiation)
- **Diagnostics**
 - Comparison of large scale fields against GFS analyses
- **Comprehensive T&E**
 - Sensitivity to cumulus parameterizations
 - Change in momentum flux in ocean model
 - Topic of remaining of this presentation

More information at dtcenter.org/HurrWRF/users

Ocean model in HWRF

- Allows greater accuracy in
 - SST field
 - Latent/sensible heat fluxes
 - Intensity
- Can represent
 - Turbulent mixing (1D), upwelling and advection (3D)
- Causes SST cooling as cold water below surface is transported up
- Is crucial because SST can change rapidly under tropical cyclones

Background

- Coupled HWRF tests (2007) indicated POM-TC **over-cooling**
- To minimize over-cooling, HWRF fluxes to POM-TC were reduced by 25%
- Yablonsky et al. (2010 IHC): confirmed POM-TC tended to **over-cool** in response to prescribed wind stress based on observed TC winds, when compared against buoy composites
- Uhlhorn and Cione (2012): 2012 operational HWRF run retrospectively for 2011 storms **under-cools** relative to buoy composites

Example: Katia initialized 09/01/2011, 12 UTC

Reasonable track forecast

Good intensity forecast

Poor ocean cooling forecast

HWRF Testing

- Hypothesis (URI): flux reduction in HWRF not necessary (and should be eliminated as it is mostly non-physical)
- Comprehensive test: 2012 HWRF with (HD12) and without (HDFL) flux reduction. Cases: entire 2012 season
- Test supports HWRF operational implementation
- Case study (Leslie 09/04 00 Z)
 - Isolation of influence of flux reduction versus initial conditions
 - Note that HWRF is cycled, so IC for a given case are not identical between HDFL and HD12
 - Understanding of non-linear physical processes involved

Atlantic track and intensity

Track ME: HD12 and HDFL very similar
Int MAE: HDFL SS better at 3 lead times
Int bias: HDFL lowers intensity and helps overintensification at long lead times
Hurricane Leslie (12L) is the storm with largest impact (large and slow)
Pacific impact is much smaller (POM-TC 1D)

Largest impact: Hurricane Leslie

ME for Intensity Error
2012: 12L(38)

- HD12 and HDFL tracks are similar
- HDFL reduces intensity (as expected)
- Case study: 09/04 00 UTC HDFL has lower intensity

Leslie: rerun with same IC 09/04 00Z

Question: How much of the difference between HDFL and HD12 for a given case is due to fluxes change as opposed to sensitivity to IC?

Method: Ran with same IC

Answer: When same IC are used, differences between HD12 and HDFL are much smaller

Forecast differences are highly influenced by IC in addition to flux differences

In each run, different fluxes make a small difference, which gets compounded by cycling

Caution should be used when differences between a pair of runs are analyzed!!

Nonlinearity in ocean response

Location X (24 h) Location Y (48 h)

0-120 h forecast

Conclusions

- Physically-based fluxes in 2012 HWRF improve AL intensity
 - 2012 HWRF has 3-km grid spacing, revised PBL and C_d , C_h , therefore physical processes are better represented
- This work demonstrated new collaborations and process
 - NOAA AOML/HRD conducted model evaluation
 - URI helped formulate hypothesis
 - DTC conducted extensive testing and case
 - HRD conducted additional verification and diagnostics studies (not shown)
 - Change accepted by EMC for HWRF 2013
- Test plan for 2013 yet to-be-determined with partners , likely
 - Thompson microphysics with RRTMG
 - Noah land surface model
